SOP-004: Delay and Route Risk Management

Document ID: SOP-004

Owner: Dispatch Operations

Applies to: All dispatchers

1. Purpose

This SOP explains how to act on delay and route risk indicators from the fleet system.

2. Key Indicators

Indicator	System field	Range	Meaning
Delay probability	`delay_probability`	0 to 1	Chance the shipment will be late
Route risk level	`route_risk_level`	0 to 10	Danger level of the current route
Port congestion	`port_congestion_level`	0 to 10	How busy the destination port is
Risk classification	`risk_classification`	Low / Moderate / High Risk	Overall shipment risk

3. Action Thresholds

- **Delay probability above 0.7** on a perishable or vaccine shipment: **Tier 2 warning**. Inform the customer of a possible delay and check whether the cargo's temperature can be held for the extra time.
- **Route risk level above 8**: consider rerouting. Contact the driver to confirm road conditions.
- **Port congestion level above 8**: check with the port agent for the expected waiting time. Reefer cargo waiting more than 6 hours at a port needs a power plug-in confirmation.
- **High Risk** classification together with a temperature excursion: escalate as **Tier 1**.

4. Rerouting Rules

- Rerouting must be approved by the **Dispatch Shift Lead**.
- A new route must not add more than **20%** to the remaining travel time for perishables.
- Always inform the driver and the customer after a reroute.
